File: USPT

Jul 13, 1999

DOCUMENT-IDENTIFIER: US 5922350 A

TITLE: Methods of dehydrating, storing and rehydrating liposomes

Detailed Description Text (8):

So that the liposomes will survive the dehydration process without losing a substantial portion of their internal contents, it is important that one or more protective sugars be available to interact with the liposome membranes and keep them intact as the water in the system is removed. A variety of sugars can be used, including such sugars as trehalose, maltose, sucrose, glucose, lactose, and dextran. In general, disaccharide sugars have been found to work better than monosaccharide sugars, with the disaccharide sugars trehalose and sucrose being most effective. Other more complicated sugars can also be used. For example, aminoglycosides, including streptomycin and dihydrostreptomycin, have been found to protect <u>liposomes</u> during <u>dehydration</u>.

TITLE: Method for loading lipid vesicles

Detailed Description Text (27):

To ensure that the liposomes will survive the dehydration process without losing a substantial portion of their internal contents, it is important that one or more protective sugars be available to interact with the lipid vesicle membranes and keep them intact as the water in the system is removed. A variety of sugars can be used, including such sugars as trehalose, maltose, sucrose, glucose, lactose, and dextran. In general, disaccharide sugars have been found to work better than monosaccharide sugars, with the disaccharide sugars trehalose and sucrose being most effective. Other more complicated sugars can also be used. For example, aminoglycosides, including streptomycin and dihydrostreptomycin, have been found to protect lipid vesicles during dehydration.

Detailed Description Text (49):

Pharmaceutical compositions comprising the liposomes of the invention are prepared according to standard techniques and further comprise a pharmaceutically acceptable carrier. Generally, normal saline will be employed as the pharmaceutically acceptable carrier. Other suitable carriers include, e.g., water, buffered water, 0.4% saline, 0.3% glycine, and the like, including glycoproteins for enhanced stability, such as albumin, lipoprotein, globulin, etc. These compositions may be sterilized by conventional, well known sterilization techniques. The resulting aqueous solutions may be packaged for use or filtered under aseptic conditions and lyophilized, the lyophilized preparation being combined with a sterile aqueous solution prior to administration. The compositions may contain pharmaceutically acceptable auxiliary substances as required to approximate physiological conditions, such as pH adjusting and buffering agents, tonicity adjusting agents and the like, for example, sodium acetate, sodium lactate, sodium chloride, potassium chloride, calcium chloride, etc. Additionally, the liposome suspension may include lipid-protective agents which protect lipids against free-radical and lipid-peroxidative damages on storage. Lipophilic free-radical quenchers, such as alphatocopherol and water-soluble iron-specific chelators, such as ferrioxamine, are suitable.

TITLE: Compositions and methods for treating lymphoma

Brief Summary Text (15):

In another embodiment, the mammal is a human. In another embodiment, the mammal has previously undergone at least one chemotherapy treatment. In another embodiment, the chemotherapy treatment comprised administration of a free-form vinca alkaloid, such as vincristine, vinblastine, vindesine, or vinorelbine. In other embodiments, the chemotherapy treatment included an anthracycline-containing combination therapy. In one such embodiment, the anthracycline was doxorubicin. In another embodiment, the mammal has exhibited a partial or complete response to the chemotherapy prior to a relapse of the cancer. In another embodiment, the relapse is a second relapse.

ASSISTANT-EXAMINER: Balasubramanian; Venkataraman

ATTY-AGENT-FIRM: Henderson & Sturm LLP

ABSTRACT:

The invention concerns a novel method for preparing vinca-alkaloids by reacting a catharantine-type product and a vindoline-type product, characterized in that it consists in selecting the reaction conditions such that the product is oxidized.

- L1ANSWER 1 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AB A process for the large scale production of a liposome suspension, in which three selected lipid compds. in a predetd. ratio are dissolved in an alc. solvent to form a mixture, which, in turn, is directly admixed with an aqueous ammonium sulfate solution in a predetd. ratio. The resultant mixture is subjected to a pore-extrusion treatment, followed by dialyzing the pore-extruded mixture with a 5% to 15% sucrose aqueous solution, such that a liposome suspension containing liposome particles suspended in the liposome suspension is obtained. The thus obtained liposome suspension can be used to encapsulate a selected drug, in particular doxorubicin.
- ANSWER 2 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN Ll
- Vinorelbine (VRL) is a particularly lipophilic member of the AB vinca alkaloids which, as a class of drugs, exhibit improved cytotoxicity and therapeutic activity through increased duration of exposure. Here, we describe and optimize a sphingomyelin/cholesterol (SM/Chol) liposome formulation of VRL to maximize in vivo drug retention, plasma circulation time, and therapeutic activity. VRL was efficiently encapsulated (>90%) into 100 nm liposomes using an ionophore-mediated loading method. VRL retention in SM/Chol liposomes after i.v. injection in mice was dependent on drug-to-lipid ratio (D/L), with higher D/L ratios exhibiting increased drug retention (0.3>0.2>0.1, weight/weight) and improved pharmacokinetics. Cryo-electron microscopic examination of a high D/L ratio formulation indicated that the intravesicular regions of these liposomes were electron dense compared with empty liposomes. The optimized, high D/L ratio SM/Chol VRL formulation showed promising activity against s.c. B16 melanoma tumors compared with VRL or SM/Chol formulations of vincristine or vinblastine. Finally, the stability of the formulation was excellent (<5% drug leakage, >99% intact VRL, no changes in liposome size after 1 yr at 2-8°). The optimized drug retention properties of the SM/Chol formulation of VRL, combined with its promising antitumor activity and pharmaceutical stability, make this formulation an excellent candidate for future clin. development.
- L1ANSWER 3 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AR A comparative study of the loading and retention properties of three structurally very closely related vinca alkaloids (vincristine, vinorelbine and vinblastine) in liposomal formulations has been performed. All three vinca alkaloids showed high levels of encapsulation when accumulated into egg sphingomyelin/cholesterol vesicles in response to a transmembrane pH gradient generated by the use of the ionophore A23187 and encapsulated MgSO4. However, despite the close similarities of their structures the different vinca drugs exhibited very different release

behavior, with vinblastine and vinorelbine being released faster than vincristine both in vitro and in vivo. The differences in loading and retention can be related to the lipophilicity of the drugs tested, where the more hydrophobic drugs are released more rapidly. It was also found that increasing the drug-to-lipid ratio significantly enhanced the retention of vinca alkaloids when the ionophore-based method was used for drug loading. In contrast, drug retention was not dependent on the initial drug-to-lipid ratio for vinca drugs loaded into liposomes containing an acidic citrate buffer. The differences in retention can be explained on the basis of differences in the phys. state of the drug inside the liposomes. The drug-to-lipid ratio dependence of retention observed for liposomes loaded with the ionophore technique may provide a way to improve the retention characteristics of liposomal formulations of vinca drugs.

- ANSWER 4 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN

 This invention provides methods for treating neoplasias in a mammal. In particular, the invention provides methods for treating various types of lymphomas, including relapsed forms of non-Hodgkin's Lymphoma. These methods involve the co-administration of liposome-encapsulated vinca alkaloids, e.g., vincristine, with a topoisomerase II inhibitor, e.g., etoposide or NK-611, to a mammal with a lymphoma or a sarcoma.
- ANSWER 5 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN L1 The present invention relates to the synthesis and biol. application of AB piperidinoyl carboxylic acid integrin antagonists affinity moiety of formula (I) and formula (II) [W = -C0-6alkyl(R1), -C1-6 alkyl(R1a), -C0-6alkylaryl(R1,R8), -C0-6 alkylheterocyclyl(R1,R8), etc.; R1 = H, (un) substituted NH2, -heterocyclyl-(R8), -heteroaryl-(R8); Rla = -C(R4)(:NR4), -C(:NR4)-N(R4)2, -C(:NR4)-N(R4)(R6), -C(:N-R4)-N(R4)-C(0)-R4R4, etc.; R4 = H, C1-8 alkyl; R8 = H, -C1-8 alkyl(R9), -CHO, -CO-C1-8 alkyl(R9), -CONH2, etc.; R9 = H, C1-8 alkoxy, each (un)substituted NH2, CONH2, or SO2NH2, CHO, etc.; q = 0-3; R2 = -C1-8 alkyl(R7)(R11), -C2-8 alkenyl(R7)(R11), -C2-8 alkynyl(R7)(R11), -cycloalkyl-(R7)(R11), -heterocyclyl-(R8)(R12), etc.; R7 = H, -C1-8 alkoxy(R9), each (un) substituted NH2 or CONH2, CHO, -CO-C1-8 alkyl(R9), etc.; R11 = -C1-8 alkyl(R14), -O-C1-8 alkyl(R14), -NH-C1-8 alkyl(R14), -S-C1-8 alkyl(R14), etc.; R12 = -C1-8 alkyl(R14), -O-C1-8 alkyl(R14), -NH-C1-8 alkyl(R14), etc.; R14 when R11 and R12 terminates with a C(:0) is selected from the group consisting of H, OH, -OC1-4 alkyl, and NH2; otherwise R14 = OH, SH, CO2H , CO2-1-4 alkyl; Z = OH, (un)substituted NH2, -O-C1-8 alkyl, O-C1-8 alkyl-OH, -O-C1-8 alkyl-C1-8 alkoxy, etc.] and pharmaceutically acceptable salts, racemic mixts., and enantiomers thereof. These affinity moieties maybe used with imaging agents or liposomes to target cells that express the $\alpha v\beta 3$, $\alpha v\beta 5$, or $\alpha v\beta 6$ integrin receptors. For example, an enantiomer of 6-methoxy- β -[[1-[1-oxo-3-(5,6,7,8-tetrahydro-1,8-naphthyridin-2-yl)propyl]-4-piperidinyl]methyl]-3pyridinepropanoic acid inhibited the binding of vitronectin to $\alpha v\beta 3$, $\alpha v\beta 5$, and $\alpha IIb\beta 3$ receptors with IC50 of 0.0003 ± 0.00002 , 0.0042 ± 0.0018 , and 1.83 ± 0.57 μM , resp.
- L1 ANSWER 6 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN Introduction: This study was designed to define the maximum tolerated dose of AB pegylated liposomal doxorubicin (Doxil) and multiday vinorelbine (VNB), without and with prophylactic filgrastim, and to identify antineoplastic Patients and Methods: Patients with resistant cancers were treated with Doxil 50 mg/m2 every four weeks, and with VNB 15 mg/m2 on the same day. The VNB dose escalations were accomplished in subsequent patient cohorts by adding VNB doses on consecutive days. When the maximum tolerated dose (MTD) of VNB with Doxil was defined, prophylactic filgrastim was added to define a second MTD. Results: Of 29 patients entered, two had early adverse events, and 27 received at least one full cycle with at least one month follow-up. The MTD of VNB, combined with Doxil 50 mg/m2, was 15 mg/m2 on day 1, with neutropenia as the dose-limiting toxicity. With prophylactic filgrastim, the MTD was 15 mg/m2 daily for two days, with neutropenia and stomatitis as dose-limiting toxicities. Palmar plantar erythrodysesthesia occurred frequently, usually after the third cycle. Objective responses were documented in six patients, all of whom received multiday VNB. Conclusion: Doxil 50 mg/m2 on day 1 of a 28-day cycle can be safely combined with VNB 15 mg/m2 day 1,

or with VNB 15 mg/m2 days 1 and 2 with filgrastim prophylaxis. Antineoplastic activity was observed in this heavily pretreated population. Future studies of Doxil 35-40 mg/m2 with multiday VNB may be worthwhile, especially in metastatic breast cancer.

- L1 ANSWER 7 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AB This exptl. article provides data concerning of the encapsulation of vinorelbine (VNR) in various liposomal composition which was achieved using different ammonium and sodium salts. The amount of VNR trapped inside the liposomes and the rate of release at 2 °C and 37 °C in buffer and in rat plasma up to 50% by volume at 37 °C, 45 °C and 55 °C (thermosensitivity liposomes), was determined by UV-vis spectrometry. VNR was encapsulated into Sterically Stabilized Liposomes (SSL) with high efficiency at 98%, using ammonium sulfate pH gradient method. The results concerning the rate of release, suggest that the lipid composition of the liposomes, the external solution (buffer or plasma) as well as the temperature play an important role of the drug release from the liposomes. Vincristine (VNC) was also studied in parallel expts. for comparative reasons.
- L1 ANSWER 8 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AB This invention provides compns. and methods for the treatment of tumors in a mammal. In particular, the invention provides liposome -encapsulated vinca alkaloids, e.g., vinorelbine, and methods of treating a mammal using such compns.
- L1 ANSWER 9 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AB The present invention is for novel compns. and methods for treating cancer, particularly, for treating cancer in mammals and more particularly in humans. The therapeutic compns. of the present invention include liposome entrapped vinorelbine in which the liposome can contain any of a variety of neutral or charged liposome-forming compds. and cardiolipin. The liposomes of the present invention can be either multilamellar vesicles or unilamellar vesicles, as desired. Vinorelbine liposomes having encapsulation efficinecy of 80% were prepared
- L1 ANSWER 10 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AB In this phase II study, 23 patients with metastatic breast cancer were treated with a combination of Caelyx (40 mg/m2 on day 1) and vinorelbine (20 mg/m2 on days 1 and 8) every 4 wk. According to the statistical design, enrollment was closed after the first stage due to the low response rate observed (four partial remissions, 12 stabilizations). Toxicity was acceptable, however, grade 3-4 neutropenia was not negligible. Our study does not support the development of this combination in advanced breast cancer.
- L1 ANSWER 11 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- The present invention provides methods and compns. for the treatment and prevention of any of a large number of diseases and conditions with an angiogenic component, e.g., cancer. The present invention is based upon the discovery that liposome-encapsulated chemotherapeutic agents, such as alkaloids (e.g., vinca alkaloids such as vincristine), are surprisingly effective at treating such diseases or conditions when administered at a higher frequency than those used with conventional administration strategies. Such methods can be used to treat diseases such as cancer even when the cancer comprises cells that are resistant to the chemotherapeutic alkaloid. The liposome encapsulation of the chemotherapeutic agents, e.g., alkaloids, imparts dramatic improvements in the stability, biodistribution, and delivery of the agents, thereby allowing more efficacious and convenient administration to a patient with any of the herein-described diseases or conditions.
- L1 ANSWER 12 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN
- AB This invention provides methods of identifying ligands that are internalized into a cell. The methods typically involve (i) contacting the cell with a reporter non-covalently coupled to a ligand; (ii) dissociating the reporter from the ligand and removing dissociated reporter from the surface of the cell; and (iii) detecting the reporter within said cell (if

any is present) where the presence of the reporter within said cell indicates that the ligand binds to an internalizing receptor and is internalized.

- L1 ANSWER 13 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN AB A review. Efforts to improve further therapy for advanced ovarian carcinoma currently focus on addition of a third active agent to front-line chemotherapy. Three agents with activity against disease clin. resistant to paclitaxel and the platinum compds. are of greatest interest: gemcitabine, topotecan, and liposome-encapsulated doxorubicin. Three strategies to add a third agent include a triplet regimen that adds a third agent concurrently; a sequential doublet regimen giving three to four cycles of the new agent plus a platinum followed by three to four cycles of paclitaxel plus a platinum; and sequential single agents consisting of three to four cycles of the new agent with three to four cycles each of paclitaxel and a platinum. Gemcitabine in combination with another agent has been evaluated to develop doublet regimens for the second of these three strategies. Combinations both feasible and active include gemcitabine plus cisplatin or carboplatin, gemcitabine plus paclitaxel, gemcitabine plus topotecan, gemcitabine plus liposome -encapsulated doxorubicin, gemcitabine plus vinorelbine, and gemcitabine plus treosulfan. The combinations of gemcitabine plus a platinum compound appear most promising with synergism suggested by the data. A gemcitabine/carboplatin doublet for four cycles followed by four cycles of paclitaxel/carboplatin is currently under evaluation in a randomized phase III trial (Gynecol. Oncol. Group [GOG] protocol 0182).
- L1ANSWER 14 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN The concentration-time profiles of Doxorubicin (DOXO) from day 0 to day 21 after AΒ i.v. infusion of 25 or 30 mg/m2 doxorubicin HCl stealth liposomes (Caelyx) were investigated in 9 patients receiving combination polychemotherapy with cyclophosphamide, vinorelbine and prednisone. Peak serum concns. occurred from 0.04 to 4.0 days after infusion (mean tmax = 1.79±1.55 d) with a mean cmax of 4595±2849 ng/mL. A total amount of 12.84±2.47 mg liposomal DOXO in the plasma volume (Vp = 2794+537 mL) could be estimated at tmax (=27% of the mean dose of 47.6 mg). Stealth liposomes were eliminated slowly from the blood with a mean t1/2el of 1.9+0.5 days (MRT was 4.6+2.5 days). AUClast values ranged from 8070 to 33446 ng/mL*d (mean $10987\pm9339 \text{ ng/mL*d}$). The low plasma clearance (Cltot = 4681 ± 2835 mL/day) and the small volume of distribution (Vz = 11.7±6.31) suggested that stealth-liposomes were stable in the blood at least for 14 days. Polychemotherapy with Hyper-CCVP schedule did not alter the stability of stealth liposomes, but peak levels of DOXO seemed to be somewhat lower compared to regression anal. of literature data (cmax vs. dosage range from 20 to 60 mg/m2). Due to clast occurring between day 12 to 18, no indexes for an accumulation of the drug in the blood could be found, when liposomes were given every four weeks.
- ANSWER 15 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN L1AB A review. Doxorubicin and other anthracyclines are an important class of agents for the treatment of early and advanced stage breast cancer, but produce substantial acute and chronic toxicities. One strategy for reducing anthracycline-associated toxicity is packaging them in liposomes. Liposomes are closed vesicular structures that envelop water-soluble mols. They may serve as vehicles for delivering cytotoxic agents more specifically to tumor, and limit exposure of normal tissues to the drug. Liposomal anthracyclines are more effective and less toxic in a number of preclin. models compared with conventional anthracyclines. Several liposomal anthracyclines have been extensively studied in humans with a variety of cancer types, including TLC D-99 (Myocet; The Liposome Company, Elan Corporation, Princeton, NJ), liposomal daunorubicin (Daunoxome; NeXstar Pharmaceuticals, Inc, San Dimas, CA), and pegylated liposomal doxorubicin (Doxil; Alza Pharmaceuticals, Palo Alto, CA, Caelyx; Schering Corporation, Kenilworth, NJ). Although none of these agents are currently approved for the treatment of breast cancer in the United States, the liposomal doxorubicin prepns. seem to have comparable activity and less cardiac toxicity than conventional doxorubicin. Furthermore, they have been safely combined with other cytotoxic agents, including cyclophosphamide, 5-fluorouracil, vinorelbine, paclitaxel, and

docetaxel. Further studies will be required to determine their role in the treatment of breast cancer.

- L1 ANSWER 16 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN AΒ This invention provides methods for treating neoplasias in a mammal. In particular, the invention provides methods for treating various types of lymphomas, including relapsed forms of non-Hodgkin's Lymphoma. These methods involve the administration of liposome-encapsulated vinca alkaloids, e.g., vincristine, to a mammal with a lymphoma. Liposomeencapsulated vincristine (vincristine sulfate liposome injection) was prepared using a six vial kit wherein vials 1 and 2 contained vincristine sulfate solution (1mg/mL Vincasar PFS)in buffer comprising mannitol and sodium acetate, pH 4.5-4.7, vial 3 contained empty liposomes (100mg/mL Sphingomyelin/Cholesterol liposomes, at a ratio of between about 60/40 to 50/50, or more preferably 55/45 mol%/o/mol%) in buffer comprising 300 mM citrate at pH 4.0, vials 4 and 5 contained an alkaline phosphate buffer (14.2 mg/mL dibasic sodium phosphate hepta hydrate), and vial 6 was an empty, sterile vial.
- L1 ANSWER 17 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN In this study, tumor uptake and clearance of doxorubicin were determined for AB two formulations of the drug: the free form in aqueous solution and the encapsulated form in polyethylene qlycol-coated (pegylated, STEALTH) liposomes composed of cholesterol/hydrogenated soy phosphatidylcholine/polyethylene glycol-distearoyl-phosphatidylethanolamine (Doxil). The detns. used confocal laser scanning microscopy in a pancreatic carcinoma model in nude mice. The movement of pegylated liposomes containing doxorubicin from blood vessels into tumors was studied using confocal microscopy combined with autoradiog. of liposomes containing a tritium-labeled phospholipid. Laser microscopy measurements showed that the liposome-encapsulated doxorubicin remained in the tumor longer than the free drug and produced a six-fold increase in the area under the concentration-time curve (AUC). Autoradiog. showed that the extravasated tritium-labeled lipid had entered the nuclei as well as the cytoplasm of tumor cells. The authors also compared the therapeutic effects of i.v. cisplatin, doxorubicin hydrochloride, vincristine sulfate, and vinorelbine tartrate, each in the aqueous free form or encapsulated in pegylated liposomes. In this pancreatic carcinoma model, the liposome-encapsulated drugs were all more effective than the free drugs in inhibiting tumor growth and in producing cures. Except for cisplatin, all of the free drugs had toxic systemic side effects indicated by an average weight loss of 3 to 5%, which was recovered by 2 to 4 wk after the last treatment. The liposome-encapsulated drugs did not cause weight loss.
- ANSWER 18 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN L1 AB Reagents for use in preparing a therapeutic liposome composition sensitized to a target cell are described. The reagents include a liposomal composition composed of pre-formed liposomes having an entrapped therapeutic agent and a plurality of targeting conjugates composed of a lipid, a hydrophilic polymer and a targeting ligand. The therapeutic, target-cell sensitized liposome composition is formed by incubating the liposomal composition with a selected conjugate. Liposomes were prepared by mixing partially hydrogenated soybean phosphatiylcholin, cholesterol, and mPEG-DSPE at a molar ratio of 55:40:3 in chloroform and/or methanol in a round bottom flask. The solvents were removed and the dried lipid film produced was hydrated with a buffer to produce large multilamellar vesicles. An anti-E-selectin Fab fragment was conjugated to PEG-DSPE to form a targeting conjugate. An adequate amount of the Fab-PEG-DSPE conjugate was added to a suspension of the above liposomes and incubated overnight at room temperature for the insertion of the conjugate into preformed liposomes.
- ANSWER 19 OF 19 CAPLUS COPYRIGHT 2005 ACS on STN

 The compatibility of doxorubicin hydrochloride liposome injection with selected other drugs during simulated Y-site administration was studied. Five milliliters of doxorubicin hydrochloride liposome injection 0.4 mg/mL in 5% dextrose injection was combined with 5 mL of each of 82 other drugs in 5% dextrose injection or, if necessary to avoid incompatibilities with the diluent, 0.9% sodium chloride injection. The combinations were examined

with the unaided eye in fluorescent light and in high-intensity monodirectional light to enhance visualization of small particles and low-level turbidity. The turbidity of each combination was measured as well. Particle sizing and counting were performed on selected combinations. Evaluations were performed initially and at one and four hours. All combinations were stored at room temperature (.apprx.23 °C). Most of the test drugs were compatible with doxorubicin hydrochloride liposome injection during the four-hour observation period. However, practitioners should be cautious in administering any drug simultaneously with doxorubicin hydrochloride liposome injection until the integrity of the liposomes can be verified. Eighteen drugs exhibited unacceptable increases or decreases in measured turbidity or particulate formation within four hours. During simulated Y-site administration, doxorubicin hydrochloride 0.4 mg/mL (as the liposomal injection) in 5% dextrose injection was compatible with 64 of 82 other drugs for four hours at .apprx.23 °C and was incompatible with 18 of the test drugs.
